

RiverWatch: Release Checklist

Protocol version 1.0 | 1 September 2026 | Fictional development fixture

All four criteria are required. A model that passes only the numerical criteria is not approved for release.

Required criterion	Pass condition
Location accuracy	Held-out RMSE at most 0.75 metres
Response time	Mean prediction latency at most 200 milliseconds
Sensor-failure evidence	Documented evaluation with missing sensors and an approved recovery procedure
Field evidence	A completed field pilot with recorded outcomes

Use corrected final results when a report explicitly supersedes a draft. Cite the correction and explain the discrepancy.

How to interpret the checklist

The latency requirement refers to the mean, not the 95th percentile. Both measures may be useful, but only the mean is the specified threshold here.

An unreported test is missing evidence. Do not assume that a model passed a test because the report does not describe a failure.

Neither numerical performance nor citations alone prove readiness for deployment. Name each missing or failed criterion in a recommendation.

This protocol does not specify an exact GPU, RAM size, statistical-significance threshold or an approved budget. Those answers cannot be inferred from it.
